

## Configuration du Serveur DHCP sous Linux

**Fait par: BELMOUBARIK Merouae**  
**Encadré par : AHMED AMAMOU**

## I. Introduction

Le présent rapport explore la configuration d'un serveur DHCP sous Linux, mettant en œuvre le protocole DHCP (Dynamic Host Configuration Protocol) pour automatiser la distribution d'adresses IP au sein d'un réseau. Cette approche vise à simplifier la gestion des adresses IP, à réduire les erreurs humaines et à améliorer l'efficacité du réseau.

## II. Fondements Théoriques

### 1. Dynamic Host Configuration Protocol (DHCP)

Le DHCP est un protocole de réseau qui permet aux appareils de recevoir automatiquement une configuration IP lors de leur connexion au réseau. Il fonctionne en attribuant de manière dynamique des adresses IP et d'autres paramètres de configuration réseau tels que la passerelle par défaut et les serveurs DNS.

## 2. Avantages du DHCP

### Avantages

Automatisation : Élimine la nécessité de configurer manuellement chaque appareil avec une adresse IP.

Gestion Centralisée : Permet une gestion centralisée des adresses IP au sein du réseau.

Réduction des Conflits : Minimise les risques de conflits d'adresses IP.

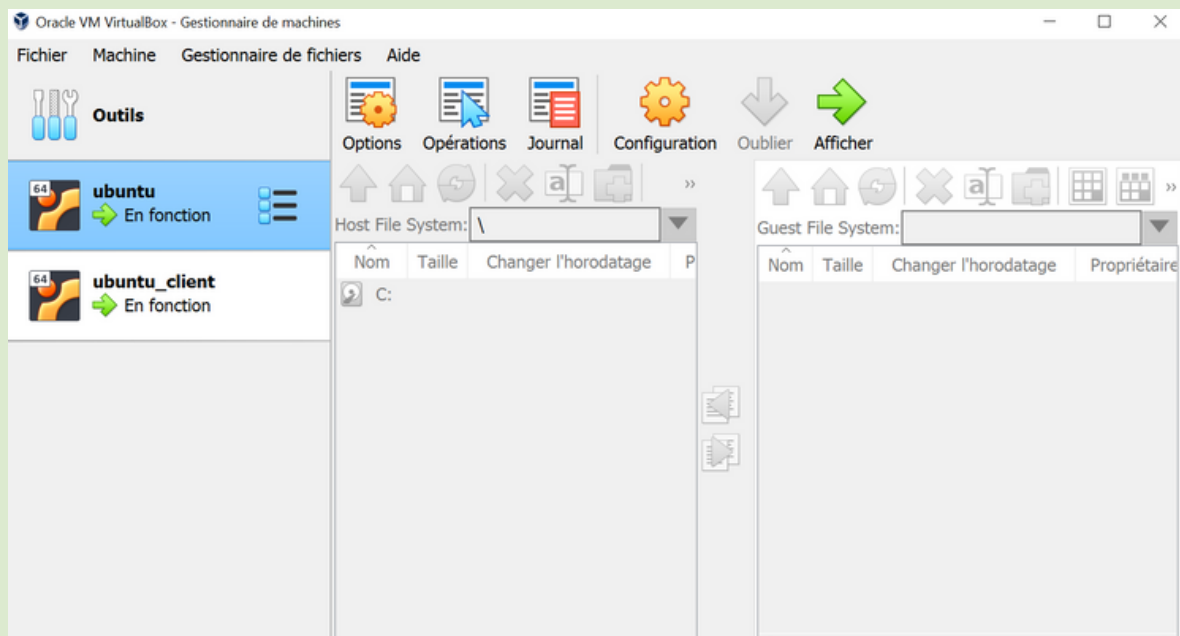

## III. Objectifs de Configuration

### Objectifs

L'objectif de cette configuration est de mettre en place un serveur DHCP pour attribuer dynamiquement des adresses IP aux clients du réseau. Les objectifs spécifiques comprennent la définition d'une plage d'adresses IP, la spécification des paramètres réseau, et l'assurance d'une gestion efficace des adresses attribuées.

## IV. Logiciels Utilisés

Le logiciel ISC DHCP Server a été choisi en raison de sa fiabilité et de sa flexibilité. Il est largement utilisé dans les environnements Linux et offre une configuration robuste du serveur DHCP.

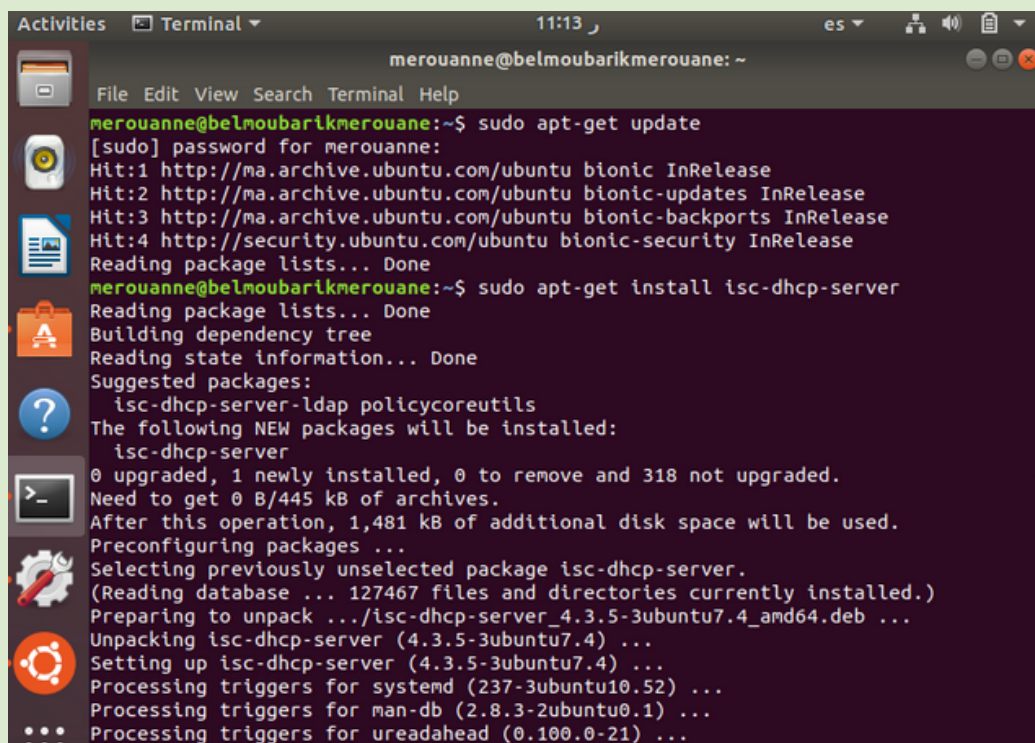

## V. Configuration du Serveur DHCP

### 1. Installation du Serveur DHCP

Le processus d'installation du serveur DHCP sous Linux a été effectué en utilisant les commandes standards du gestionnaire de paquets.

```
sudo apt-get update
```

```
sudo apt-get install isc-dhcp-server
```

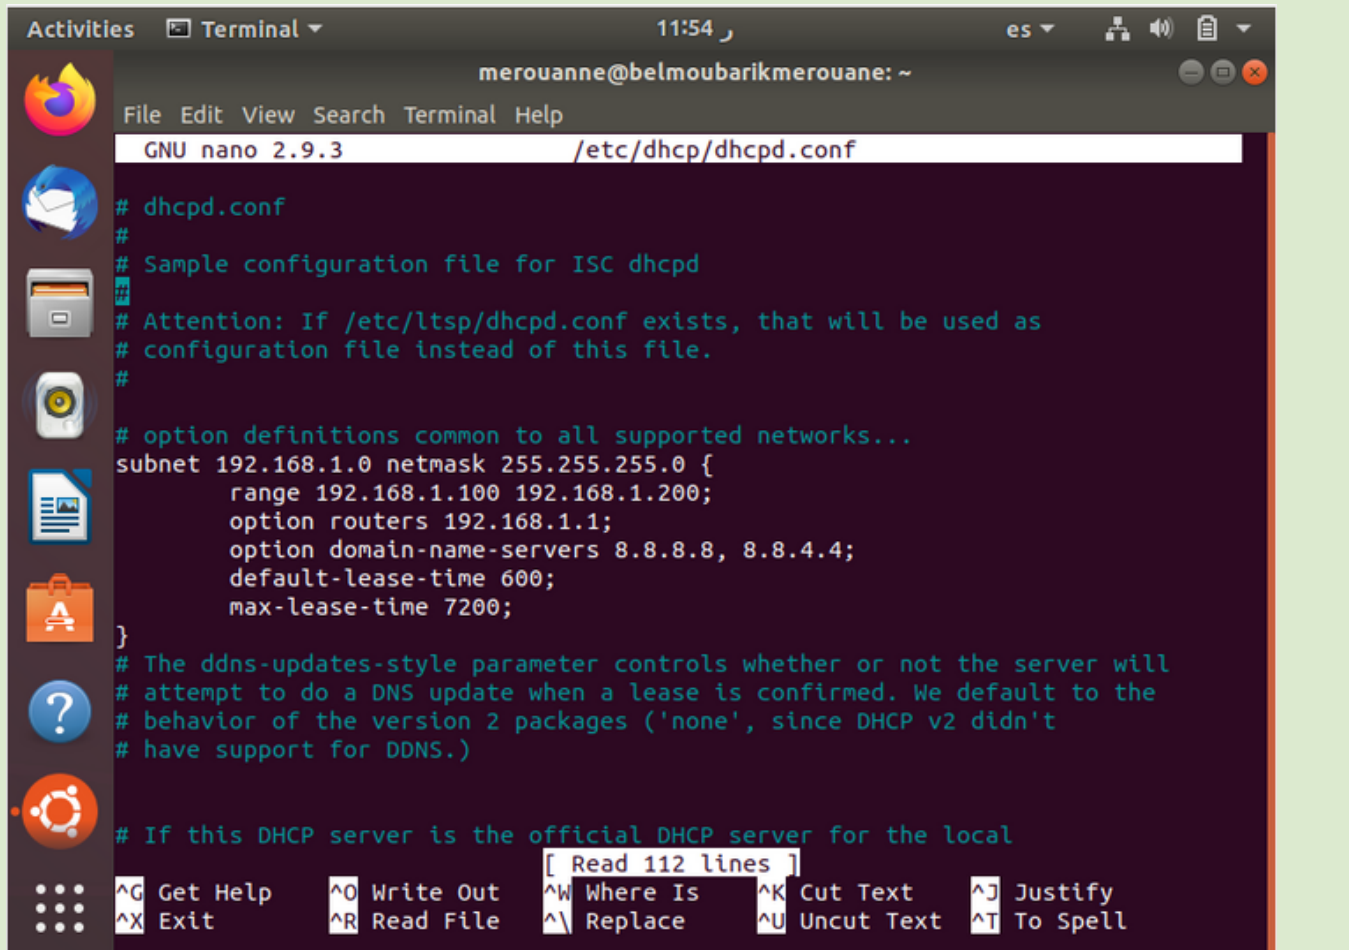

```

## V. Configuration du Serveur DHCP

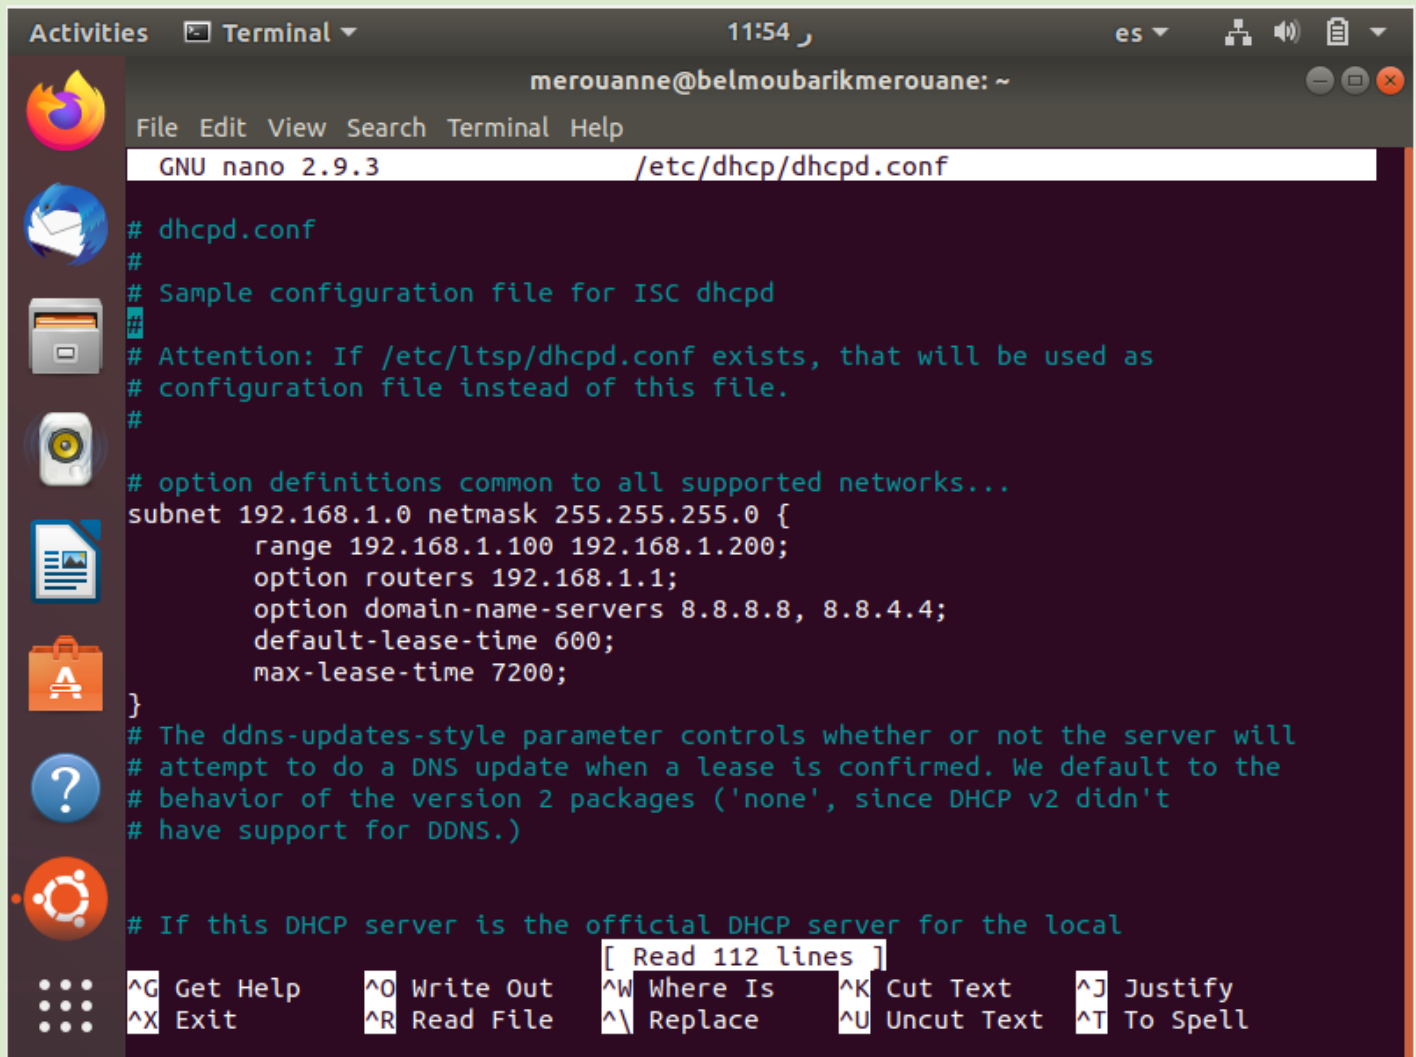

### 2. Configuration du Fichier dhcpd.conf

Le fichier de configuration principal, /etc/dhcp/dhcpd.conf, a été modifié pour définir le sous-réseau, la plage d'adresses, et d'autres paramètres. Cela garantit une attribution cohérente des adresses IP aux clients.

```
merouanne@belmoubarikmerouane:~$ sudo nano /etc/dhcp/dhcpd.conf
merouanne@belmoubarikmerouane:~$ sudo nano /etc/default/isc-dhcp-server
```

```
# dhcpd.conf
#
# Sample configuration file for ISC dhcpd
#
# Attention: If /etc/ltsp/dhcpd.conf exists, that will be used as
# configuration file instead of this file.
#
# option definitions common to all supported networks...
subnet 192.168.1.0 netmask 255.255.255.0 {
    range 192.168.1.100 192.168.1.200;
    option routers 192.168.1.1;
    option domain-name-servers 8.8.8.8, 8.8.4.4;
    default-lease-time 600;
    max-lease-time 7200;
}
# The ddns-updates-style parameter controls whether or not the server will
# attempt to do a DNS update when a lease is confirmed. We default to the
# behavior of the version 2 packages ('none', since DHCP v2 didn't
# have support for DDNS.)
#
# If this DHCP server is the official DHCP server for the local

## Redémarrer le serveur DHCP :

Après avoir effectué les modifications, redémarrez le service DHCP pour appliquer les changements.

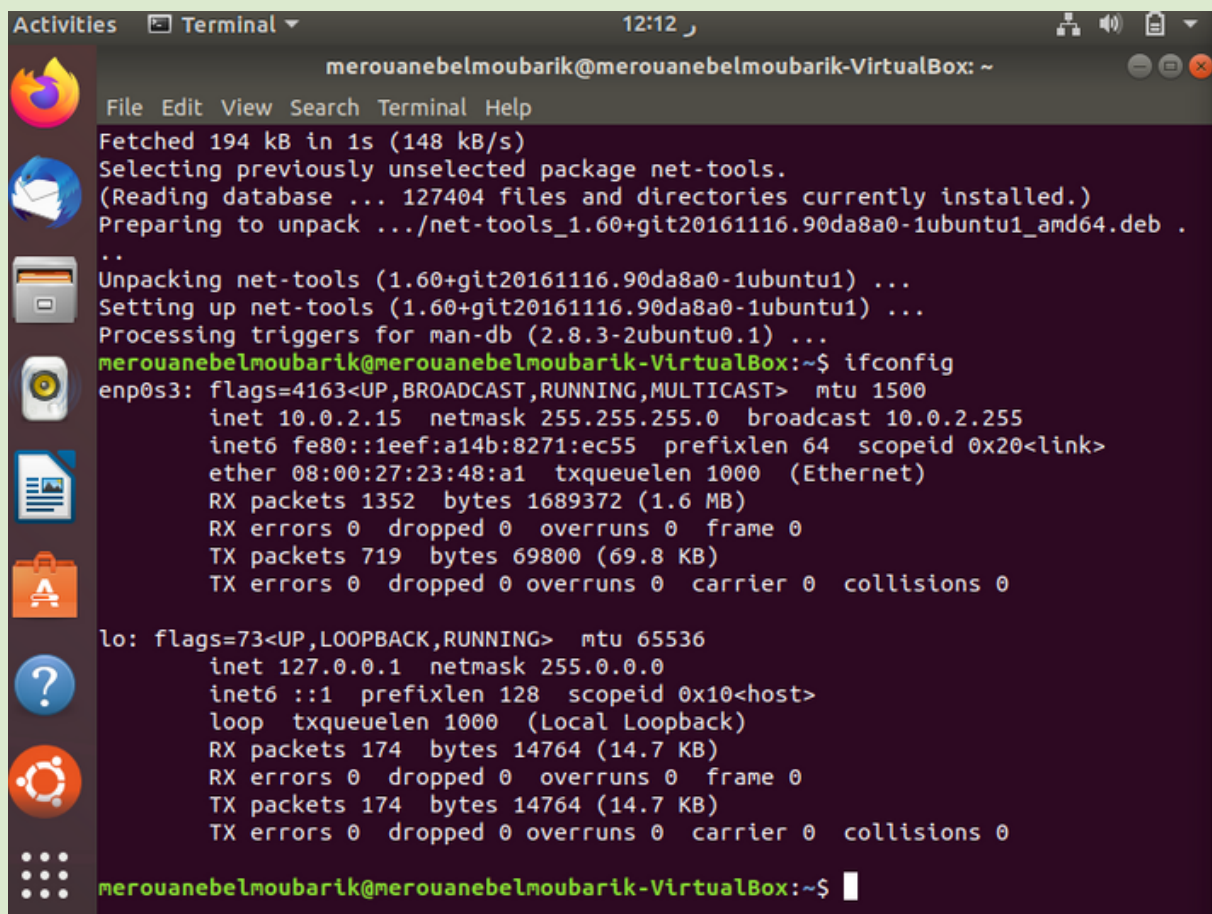

**sudo service isc-dhcp-server restart**

A terminal window with a dark background. The prompt is 'merouanne@belmoubarikmerouane:~\$'. The command 'sudo service isc-dhcp-server restart' is entered. A cursor is visible at the end of the command.

```
merouanne@belmoubarikmerouane:~$ sudo service isc-dhcp-server restart
```

## VI. Tests de Validation

DES TESTS APPROFONDIS ONT ÉTÉ RÉALISÉS POUR VALIDER LA CONFIGURATION, NOTAMMENT DES SIMULATIONS DE CONNEXION DE CLIENTS, DES VÉRIFICATIONS D'ATTRIBUTION D'ADRESSES IP, ET DES ANALYSES DE LA STABILITÉ DU SERVICE.

La machine cliente a pris une adresse ip dans la plage que nous avons configuré en serveur dhcp (Entre 192.168.1.100 et 192.168.1.200)

## Conclusion

La configuration du serveur DHCP a été menée avec succès, démontrant l'efficacité du protocole DHCP dans la gestion des adresses IP. Cette approche offre une solution automatisée et scalable pour les réseaux, améliorant la flexibilité et la facilité de gestion.
